

The Banner Bar gives clinicians a face-up indicator of a patient's COVID-19 status. Users can quickly and easily view if an order has been placed or view the patient's test result, if available. The COVID-19 demographics bar looks across the patient's orders and encounters to return the latest documented result.

Banner Bar Updates

Four different statuses with the corresponding date/time ordered or resulted are displayed based on the status of the COVID-19 order.

- **Not Ordered:** Will display if there is no COVID-19 result and no outstanding order in the patient's chart. 
- **PUI Ordered:** Will display in the banner bar if the patient has COVID-19 order placed and is waiting on lab result. 
- **Not Detected:** Displays if the lab result is negative. 
- **Detected:** Displays if the lab result is positive. 

IMPORTANT: If a patient has a repeat test, the banner bar will not re-flag to display a PUI Ordered status; however, it will retain the first result until the repeat test is posted.

NOTE: The PUI Ordered status will not display in the Banner Bar when the Administrative Order for COVID-19 is placed since the test is used to for patients who don't have symptoms and are either 1) going for an aerosol-generating procedure, 2) required for discharge to a nursing home or Acadia Hospital, or 3) a woman who presents in labor or 24-48 hours prior to a scheduled C-Section. All other statuses display as described above.
