

Global Find functionality in Pyxis Medstation allows you to search for any active facility formulary medication. If a medication is unavailable at the device currently being accessed, Global Find allows you to view where the medication is located in other Medstations.

Accessing Global Find

- STEP 1:** Navigate to the **Med Profile** screen for the patient in which you are removing medications for.
- STEP 2:** If you see the medication you want to remove greyed out on the **Med Profile** screen, select the medication.
- STEP 3:** The **Medication Availability Tool Tip** will display why the medication is not available and will display alternative locations of devices within your local area.
- STEP 4:** Select the **Find More** link to include devices outside of your local area where the medication may be available and/or accessible.
- STEP 5:** A list of **Global Find Results** will appear. Select the chevron to show/hide devices that are associated with an area.

NOTE: If a medication is not accessible on the Med Profile, Global Search should be used. If a particular medication is not found via Global Search, a phone call to the inpatient pharmacy or nursing supervisor (after pharmacy is closed, if applicable at your site) should occur.
